

Introduction

- This installation information is only valid for the K 200 fan heating unit.
- On receipt of the goods, remove all packaging material and check all the items for transport damage.
- Check that the delivered goods correspond to the specifications of the delivery note.
- For further information as to installation dimensions, weights, performance, and so on, please refer to the drawings, product information sheets, etc.

NOTE!

Before starting installation work, read the documentation accompanying the product.

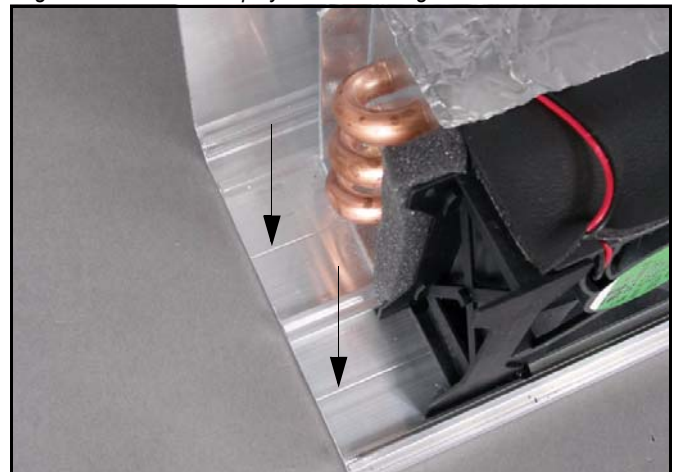

The correct function and performance of the product are only guaranteed on condition that the instructions given in this document are strictly followed.

Mounting of the K 200 Fan Heating Unit

Mounting the K200 base plate

First, you need to unscrew the eight torx-screws and lift off the cover (see service instructions next page). The K 200 is designed to be bolted through the base plate to the floor of the vehicle. To help you when drilling the holes there are two parallel notches (see figure right).

Figure: The notches helps you when drilling the holes

Water and electrical installation

Once the K200 is mounted then connect the two hoses to the 22 mm connection and the electrical connections (see figure right).

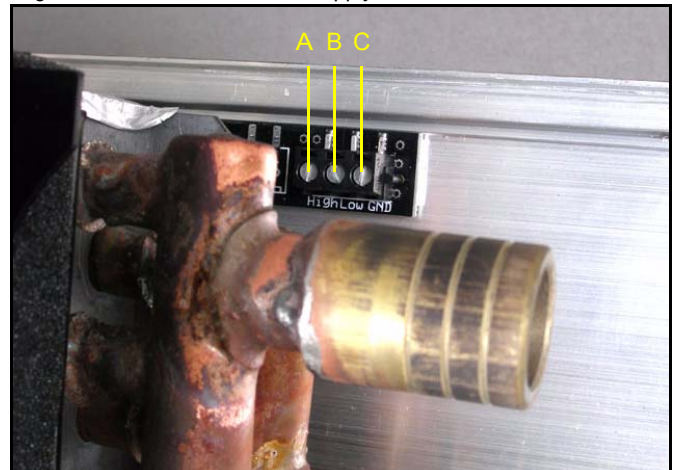

Connection of the circuit board terminals

- A 24V High speed
- B 24V Low speed
- C GND

The circuit board can easily be damaged. Be careful when screwing the screws so you're not damaging the circuit board.

Figure: Connection of the 24 V supply

Service of the Whisper K200 Fan Heating Unit

Due to the long life of the components it is not expected to do frequent service. Best cleaning is done with a vacuum cleaner to remove accumulated dust and scrap.

Should entrance to the unit be required then it is easy to remove the cover.

1. Remove the upper front screw from both ends.

2. Remove first top then the bottom of the cover.

3. Place the cover in the groove, bottom first then the top.
